

MOLECULAR FUNCTION OF PROTEGO ACTIVE

OUR PROTEGO PRODUCTS

SPORT ENDURANCE PROTEGO ACTIVE

PROTEGO ACTIVE is a special treatment which provides baselayer clothes with surprising features, making the garment a real energy dispenser.

Based on basket- molecules nanotechnology, with **PROTEGO ACTIVE** garments are treated through application of nano- particles which can absorb substances in itself and then release them within a predetermined time. These particles can be re-loaded simply by washing in a solution which is available in recharge kit. Studies and panel tests evidence testify that wearing a **PROTEGO** treated garment provides you with improved sport performance, as well as better comfort, better muscle tonicity and lower need to drink.

PROTEGO ACTIVE technology therefore matches the above mentioned benefits with total eco- friendly treatment, processes are activated using starch-derived oligosaccharides frequently used in food and drug industry, and the contents of released substances are used in the most common energy – dispenser products. At present, **PROTEGO ACTIVE** is being used in sportswear, while **GIANIS** is studying products for and drug industries.
